this interdisciplinary work discloses an unexpected coherence between recent concepts in brain science and postmodern thought a nonlinear dynamical model of brain states is viewed as an autopoietic autorhoetic self organizing self tuning eruption under multiple constraints and guided by an overarching optimization principle which insures conservation of invariances and enhancement of symmetries the nonlinear dynamical brain as developed shows quantum nonlocality undergoes chaotic regimes and does not compute heidegger and derrida are appropriated as dynamical theorists who are concerned respectively with the movement of time and being ereignis and text difference the chasm between postmodern thought and the thoroughly metaphysical theory that the brain computes is breached once the nonlinear dynamical framework is adopted the book is written in a postmodern style making playful opportunistic use of marginalia and dreams and presenting a nonserial surface of broken complexity series a

the book contains the proceedings of the 2010 conference of the italian systems society papers deal with the interdisciplinary study of processes of changing related to a wide variety of specific disciplinary aspects classical attempts to deal with them based on generalising approaches used to study the movement of bodies and environmental influence have included ineffective reductionistic simplifications indeed changing also relates for instance to processes of acquisition and varying properties such as for software growing and aging biological systems learning cognitive systems and socio economic systems growing and developing through innovations some approaches to modelling such processes are based on considering changes in structure e g phase transitions other approaches are based on considering 1 periodic changes in structure as for processes of self organisation 2 non periodic but coherent changes in structure as for processes of emergence 3 the quantum level of description papers in the book study the problem considering its transdisciplinary nature i e systemic properties studied per se and not within specific disciplinary contexts the aim of these studies is to outline a transdisciplinary theory of change in systemic properties such a theory should have simultaneous corresponding and eventually hierarchical disciplinary aspects as expected for a general theory of emergence within this transdisciplinary context specific disciplinary research activities and results are assumed to be mutually represented as within a philosophical and conceptual framework based on the theoretical centrality of the observer and conceptual non separability of context and observer related to logically open systems and quantum entanglement contributions deal with such issues in interdisciplinary ways considering theoretical aspects and applications from physics cognitive science biology artificial intelligence economics architecture philosophy music and social systems

exploring the emerging and vibrant field of critical agrarian studies this comprehensive handbook offers interdisciplinary insights from both leading scholars and activists to understand agrarian life livelihoods formations and processes of

change it highlights the development of the field which is characterized by theoretical and methodological pluralism and innovation

although in recent years some emerging economies have improved their performance in terms of r d investment outputs and innovative capacity these countries are still blighted by extreme poverty inequality and social exclusion hence emerging countries are exposed to conditions which differ quite substantially from the dominant oecd model of innovation policy for development and welfare this research handbook contributes to the debate by looking at how innovation theory policy and practice interact and explains different types of configurations in countries that are characterized by two contrasting but mutually reinforcing features systemic failure and resourcefulness focusing on innovation governance and public policies it aims to understand related governance failures and to explore options for alternative more efficient approaches

this issue of progress in physics features a collection of articles on theoretical and experimental physics as well as related topics in mathematics the main theme appears to be a re evaluation of fundamental concepts in physics with several papers discussing alternatives to established theories one article proposes correct solutions for rotating and charged black holes suggesting they have an oblate spheroid shape rather than being perfectly spherical another paper presents a new cosmology framework based on a krogh gravity theory that predicts the hubble redshift curve without needing concepts like dark energy or expansion other topics include an analysis of fundamental forces from numerical relations a re examination of quantum mechanics in the microworld and the feasibility of non quantum teleportation
